"Thermally Activated Origin of Microcracks in Crystals"

Kiev, Problemy Prochnosti, No 2, 1971, pp 36-38

**Abstract:** A brief analysis is given of a possible system of thermally activated origin of microcracks in crystals by means of fusion of the leading accumulation dislocations with account taken of the movement of succeeding dislocations. The obtained results have led to the reconsideration of some concepts concerning the necessary conditions of the power advantage of this process, and the least necessary number of dislocations in the accumulation. 2 figures. 9 bibliographic entries.

"The Formation of Cracks in the Braked Slip Band"

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 31, No 4, Apr 71, pp 838-842

**Abstract:** A study is made of the formation of cracks of various types in the braked slip band. Taken into account are conditions under which the slope sides lose their stability and begin to disintegrate. The conditions under which cracks develop perpendicularly to slip lines in their fore part were established. When the development of cracks parallel to the slip lines is related to the break of dislocation sides in the band, their origination is specified by conditions of the coming disintegration of slope sides. It is shown that the strength of slope sides is characterized by a dimensionless factor which can be determined from a given system of equations of the configuration of the bent slope side. The bending of slope sides and their stability in an inhomogeneous stress field created in the slip band by other slope sides is analyzed. One illustr., seven formulas, eleven biblio. refs.

"Plastic Mechanism of Crack Growth"

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 30, No 6, Dec 70, pp  
1270-1278

**Abstract:** The mechanism of blunt crack development was investigated from which it was shown that these cracks are intermittently developed by means of absorption of small dislocation cracks. Qualitative and quantitative results were obtained on the relative conditions of nucleation and coalescence of small cracks.

Development of a main crack may be limited by different processes in relation to the magnitude of parameter  $m$  ( $m = \sigma\sqrt{\lambda}/(\sigma\sqrt{\lambda})G$ ). At small values of  $m$  the development of a main crack is limited by the coalescence process of counter dislocation cracks, and at large values of  $m$ -by process of their nucleation. For a given  $m$  the counteracting cracks can be nucleated at some critical distance from the apex of the main crack. This causes a

discontinuity in development of the main crack. In view of the same mechanism of development the main crack again becomes blunt after each job. The rapid development of the main crack starts only when its dimensions in the process of plastic development grow substantially inasmuch as  $m$  is increased then and the tensile stresses in the apex of the blunt crack can achieve values of the theoretical strength of a material.

The authors express their thanks to A. N. ORLOV for his evaluation of the work.

"Pressing Problems in the Theory of the Formation of Dislocation Cracks"

Sverdlovsk, Finitsa Metallov i Metallovedeniye, Vol 30, No 1, Sep 76, pp 490-510

**Abstract:** A review is made of the results of theoretical works on the formation of dislocation cracks performed in recent years. Important results are produced in the clarification of old models of crack formation. It is determined that consideration of the discrete nature of dislocations and their mobility in the process of opening of a crack leads to easier conditions of formation than those indicated by the old investigations, and that combination of the first few dislocations occurs due to thermal fluctuations. The last section discusses the principal problems of the theory of crack formation as a portion of the theory of defects in crystals.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE PAPER IS CONCERNED WITH THE INVESTIGATION OF LONGITUDINAL ELECTRIC FIELDS (IS APPROXIMATELY EQUAL TO 1 V-CM) ARISING IN A HOMOGENEOUS PIEZOELECTRIC CRYSTAL AT HIGH LEVEL OF OPTICAL EXCITATION. THE SIGN OF THE EFFECT CORRESPONDS TO THE DRAG OF FREE CARRIERS (ELECTRONS IN THE CASE OF COS) IN THE DIRECTION OF LIGHT PROPAGATION. THE MAGNITUDE OF THE EFFECT AND ITS KINETICS HAVE BEEN RELATED TO LIGHT INTENSITY, TEMPERATURE, CRYSTAL ORIENTATION, AND THE DISTANCE BETWEEN THE PROBE POINTS. THE EFFECT IS ASSUMED TO BE A RESULT OF THE GENERATION OF A PHONON PACKET, REFERRED TO BY THE AUTHORS AS ACUSTOOPTICAL DOMAIN, AND CARRIER DRAG BY THIS DOMAIN. CALCULATIONS BASED ON THE BOLTZMANN EQUATION FOR THE ELECTRON DISTRIBUTION FUNCTION GIVE A REASONABLE PHONON DENSITY INSIDE THE DOMAIN WHICH IS NECESSARY FOR GENERATING THE ELECTRIC FIELD OBSERVED. THE ESTIMATIONS BASED ON THE CALCULATED PHONON DENSITY SHOW THAT CONSIDERABLE MECHANICAL STRESSES EXIST IN THE DOMAIN AREA WHICH CAN RESULT IN THE DESTRUCTION OF THE CRYSTAL WHEN INCREASING THE LIGHT INTENSITY; SO FAR THE EFFECT EXAMINED CAN BE DIRECTLY RELATED TO THE PROBLEM OF OPTICAL STRENGTH.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE DISLOCATION MULTIPLICATION MODEL IS APPLIED TO THE CALCN. OF THE RANGE OF HARDENING WHEN THE BROADENED BANDS COVER THE ENTIRE CRYSTAL. THE DISLOCATION STRUCTURE OF THE CRYSTAL AT THE STAGE OF HARDENING CONSISTS OF SCREW AND EDGE DISLOCATIONS DISTRIBUTED THROUGHOUT THE VOL. SCREW DIPOLES ARE FORMED BY INTERACTING SCREW DISLOCATIONS TRaversing THE ENTIRE CRYSTAL. EDGE DIPOLES ARE PRODUCED BY THE DOUBLE TRANSVERSE SLIP (EJECTION) OF SECTIONS OF SCREW DISLOCATIONS. WHEN EXTERNAL SHEAR STRESS IS INCREASED, SCREW DIPOLES ARE DECOMPD, AND CHANGE INTO MOBILE DISLOCATIONS. THE CRIT. HEIGHT OF THE EJECTION IS DECREASED, AND AS A RESULT A PART OF THE EDGE DIPOLES IS ACTIVATED CHANGING INTO SOURCES OF DISLOCATIONS. MOBILE SCREW DISLOCATIONS, FORMED FROM SCREW DIPOLE DECOMPN. AND EDGE DIPOLE ACTIVATION, PERFECT THE EJECTIONS. THUS, THE ABOVE MODEL DECSKRIBES WELL NOT ONLY BROADENING OF INDIVIDUAL GLIDE BANDS BUT ALSO THE DEFORMATION IN THE REGION OF HARDENING, IN THE CASE WHEN ONLY ONE SYSTEM OF SLIP IS AT WORK. Translation: A linear adaptive filter used for isolating a signal with known correlation function from interference of arbitrary type is an extremely complex system. It is suggested that the structure of the filter can be appreciably simplified by substituting nonlinear inertialess elements with fixed parameters for the linear circuits of the adaptive filter, and by eliminating modules designed for adaptation and learning (in this case the filter will no longer be optimum). The authors consider passage of a signal of the telegraph point type, white noise in the Gaussian band, and sinusoidal interference through a frequency-selective clipper. It is found that for the same signal-to-noise ratio at the input, the signal-to-noise ratio at the output decreases with an increase in the number of

channels (in the absence of sinusoidal interference). It is shown that the frequency-selective clipper is most effective in suppressing lumped interference. When studying the rms error in filtration as a function of the ratio of signal power to noise, it is found that a reduction in the clipping level leads to a reduction in the effect of interference on the total signal power combined with interference and noise at the output of the frequency-selective clipper. This is particularly evident in the case of a variable threshold. Ye. L.

## AWARDS OF MEDALS AND PRIZES

[Announcements: Moscow, Vestnik Akademii Nauk SSSR, Russian, Vol. 42, No. 5, April 1972, pp. 137-141]  
The Gold Medal goes to A. M. Lyapunov.

A. M. Lyapunov of the AS USSR has awarded the 1971 Gold medal, inscribed "A. M. Lyapunov to Academician Vasilii Sergeyevich Vladimirov for the mono-

(Mathematical Problems of One-velocity Kinetic Theory of Particle Transfer).

In connection with the development of atomic power engineering the mathematical physicists have been interested by a new class of problems of mathematical physics - boundary-value problems for transfer equations. These equations are widely used in geophysics and astrophysics. However, they have found very important application in problems of neutron physics and the transfer of quantum-mechanical particles in a medium.

In the monograph which won the prize, which was published in 1961, systematically presented for the first time in world literature. The author presents mainly the results of his own investigations conducted in 1956.

The first part of the work contains a mathematical formulation of the problem. In suitably selected function spaces, the general qualitative properties of the problem are investigated on that basis. A number of sufficient conditions for the existence of eigenvalues and completeness of systems of eigenfunctions, for which further properties of solutions of the problem, in particular certain properties or smoothness of the solution of the problem, in

construction of solutions (approximate) and their substantiation, are given in the first part. The author proposes and substantiates a new variational principle for a transfer equation, one which now bears his name. By means of the variational principle found by him he succeeded in obtaining

"On the Representation of the Jost-Lehmann-Dyson Type"

Moscow, Teoreticheskaya i Matematicheskaya Fizika (Theoretical and Mathematical  
Physics), Vol. 3, No 3, June 1970, pp 305-219.

**Abstract:** An integral representation is obtained for functions holomorphic in tubular domains over arbitrary acute cones  $C$  and  $-C$  and in a neighborhood of real  $n$ -divided open set  $\Omega$  and belonging to algebras  $H(C)$  and  $H(-C)$ . The technique of the boundary values of the holomorphic functions of many complex variables differs considerably from the traditional methods used for obtaining the Jost-Lehman Dyson representation. Use is not made of the representation of the solution to the Cauchy problem for the wave equation. The representation obtained makes it possible to write a new Nakanishi type integral representation for the scattering amplitudes  $T(s, t)$  within the framework of the theory of perturbations corresponding to plane converging Feynman diagrams. The authors thank O. I. Sav'yalova for consultation on perturbation theory. Orig. art. has 21 refs.

"Self-Modeling Asymptotic Behavior in Quantum Field Theory, Part I"

Moscow, Teoreticheskaya i Matematicheskaya Fizika, Vol. 12, No 1, 1972, pp  
3-17

**Abstract:** This paper is the first part of a series dealing with the theory of highly inelastic processes in the interaction of leptons and nucleons. The authors begin their analysis with a Fourier transform useful in the process of the highly inelastic dispersion of an electron by a nucleon, and they propose a method for investigating the asymptotic behavior of the form factors for that transform on the basis of the general principles of local quantum field theory. They indicate the conditions under which self-modeling behavior of the form factors occurs in the asymptotic region and derive a connection between the nature of the self-modeling and the analysis of the dimensionality. It is asserted that this method can be extended to the general problem of the highly inelastic interactions of leptons and nucleons. The authors express their gratitude to D. I. Blokhintsev, A. A. Logunov, A. A. Markov, V. A. Matveyev, R. M. Muradyan, O. A. Khrustalev, V. P. Shelest, and D. V. Shirokov; they are associated with the V. A. "The  $\theta$ -Pinch in Semiconductors"

Leningrad, Fizika Tverdogo Tela, Vol 12, No 6, June 1970, pp 1635-  
1637

Abstract: In this article are derived the criteria for the formation of a diffusion  $\theta$ -pinch in the nondegenerated and degenerated electron-hole plasma of semiconductors, when the inertia of the electrons and of the holes plays no part and the thickness of the skin layer is much greater than the radius of the sample. Consideration is given to the case in which the relaxation times of the current carriers are much less than the buildup time of the magnetic-field pulse. In such a case, forcing out of the electron-hole plasma toward the axis of the sample takes place as a result of the drift of electrons and holes in the magnetic field  $H_z$  and in the electrical field  $E_\theta$  induced thereby. It is shown that the  $\theta$ -pinch can be realized in Ge and can be used as a contactless method for the creation of non-equilibrium carriers in semiconductors.

the Lower Volga Delta"

Moscow, Meditsinskaya Parazitologiya i Parazitarnyye Bolezni, Vol 42, No 1, Jan/  
Feb 73, pp 5-11

**Abstract:** Observations carried out in the lower Volga delta (Obzhorsk district of the Astrakhan' Reservation) through Jun/Aug in 1966-67 indicated that 6 mosquito species, 12 gadfly species, and 2 gnat species breed there. The most numerous species of mosquitoes were *Aedes vexans* and *Anopheles hircanus* and the most numerous species of gadflies *Hybomitra acuminatus* and *H. peculiaris* and also (in 1966, a year of high floods) *Chrysops relictus* and *Car. flavipes*. The maximum activity of mosquitoes and gnats, as far as attacks on humans were concerned, was in the morning and evening hours, and the maximum activity of gadflies in the daytime. Among mosquitoes only *Ae. vexans* and *Ae. caspius* attacked in the daytime in the shade - *An. hyrcanus*, *An. maculipennis*, and *Mansonia richiardii* mosquitoes became active in the cool air after dark. Of gadflies

"A Tool for Unilateral Thermocompression Welding"

"USSR Author's Certificate No 274630, filed 4 Mar 69, published 7 Oct 70  
(from RZh-Radiotekhnika, No 6, Jun 71, Abstract No 6V216 P)

Translation: This Author's Certificate introduces a unilateral thermo-compression tool for welding parts covered with a layer of insulation without prestripping. Two V-shaped heating elements of refractory metal plate are welded together to form a W-shaped electrode. The gap between the elements is equal to the thickness or diameter of the part to be welded. The working sections of the heating elements are pointed to ensure local heating. The points are placed on the uppermost part to be welded. A current is passed through the free ends. The insulation in the tool changes direction and goes through the parts being welded from one pointed section to the other, i. e. there is an automatic switch to welding by two points. Heating of the elements ceases, and they act as unilateral contact welding electrodes with a microgap between them. The tool redistributes the currents in the heating and welding circuits, stabilizes the welding process, extends the useful life of the heating elements, extends

"Chemiluminescence Associated with the Formation of Lipid Peroxides in  
Biological Membranes. IV. Role of the Change in Iron Valence in These Processes"  
Moscow, Biofizika, Vol 15, No 4, Jul/Aug 70, pp 622-628

**Abstract:** In earlier studies it was shown that a suspension of mitochondria in the presence of iron ions develops luminescence as a result of the peroxidation of lipids. Experiments are described which indicate that mitochondria in suspension accumulate and partly reduce  $\text{FeCl}_3$  or a complex of  $\text{Fe}^{3+} + \text{ADP}$  when added to an incubation mixture. Catalytic agents (ortho- and pyrophosphates) increased the latent period and intensity of luminescence of the suspensions by accelerating the oxidation of  $\text{Fe}^{2+}$  with air. In the absence of phosphates, oxygen was utilized very slowly. The systems that reduce the oxidized iron, e.g., phosphates, probably also regulate the processes of peroxide oxidation of lipids in cells.

Chair of Biophysics, Second State Medical Institute imeni N. I. Pirogov  
"Luminescence of Histones in Aqueous Solutions"  
Moscow, Molekulyarnaya Biologiya, No 1, 1970, pp 9-15

**Abstract:** The absorption spectra (250-320 nm) and luminescence (290-370 nm) of four histone fractions from calf thymus was studied in aqueous solutions at pH 2-12 and sodium chloride concentrations of 0-1.5 M. The absorption spectra corresponded to the total absorption of phenylalanine and tyrosine residues; the luminescence spectra were caused by the phenol groups of the histones. The tryptophan-containing nonhistone admixtures made some contribution to the absorption and luminescence of the F1 histone. The quantum yield of luminescence of the phenol groups peaked in 0.8 M NaCl solutions at pH 2 and at 0.13% for the F1, F2a, and F3 fractions and 0.09M for the F2b fraction. At alkaline pH, quenching of the luminescence of the F1 histone took place at the same pH values as ionization of 1/2

USSR

VLADIMIROV, YU. A., et al., Moscow, Molekulyarnaya Biologiya, No 1,  
1970, pp 9-15

the phenol groups, but at lower pH values in the case of the other  
histones. This difference may have been due to the interaction of  
the tyrosine residues in the molecules of the F2a, F2b, and F3  
histones with the proton acceptors and/or to quenching resulting  
from the migration of energy between the phenol groups.

LUMINESCENCE OF HISTONES IN WATER SOLUTIONS

Vladimirov, Yu. A.; Dobretsov, G. Ye.; Borshchevskaya, T. A.

Second State Moscow High School of Medicine, USSR, Moscow

The absorption spectra (250—320 m $\mu$ ) and the luminescence spectra (290—370 m $\mu$ ) of four histone fractions from calf thymus have been studied in water solutions at pH 2—12 and at the concentration of sodium chloride 0—1.5 M. The absorption spectra corresponded to the sum of the absorptions of phenylalanine and tyrosine residues; the luminescence was connected with phenol groups of histones. Some traces of tryptophan-containing non-histone protein did contribute in the luminescence and absorption of histone F1. The quantum yield of the luminescence of phenol groups had the maximum value in

AP0044688

0.8 M NaCl solution at pH 2: (0.13 for F1, F2a, F3 and 0.09 for F2b). At alkaline pH the quenching of luminescence of histone F1 and the phenol groups ionization took place at the sample pH values, while for the other fractions the pH values of the maximum quenching of the luminescence were lower than those of ionization. It is possible that this difference is due to interaction of tyrosine residues and proton acceptors in the histone F2a, F2b, F3 molecules and (or) to the quenching caused by energy migration in phenol groups.

"An Investigation of the Conformational Properties of Biological Membranes by the Protein Luminescence Method"

Moscow, Molekulyarnaya Biologiya, Vol 6, No 2, Mar/Apr 72, pp 189-195

**Abstract:** This article is a study of the changes which occur in the luminescence spectrum of proteins in a biological membrane when the conformation of the proteins is modified as a result of changes in the pH and temperature of the surrounding medium.

In acid media ( $\text{pH} \leq 3$ ) and alkaline media ( $\text{pH} \geq 10$ ), when the surfaces of the membranes were positively and negatively charged, respectively, it was discovered that diffusion of light by the membranes decreased, indicating a reduction in their clustering properties. Eventually, the static repulsion of like charges caused the membranes to disintegrate. In the extreme pH ranges, a long-wave shift in the maximum of the luminescence spectrum was also observed.

When the pH of the suspensions was lowered from 7 to 4.5, the diffusion of light increased steadily, reaching a maximum at pH 4.5-5.0; this was the result of a greater clustering of the membrane particles due  
1/2

USSR

KLEBANOV, G. I., et al., Molekulyarnaya Biologiya, Vol 6, No 2, Mar/Apr 72,  
pp 189-198

to the equal number of positive and negative charges. This change in light diffusion was not accompanied by any change in the position of the maximum of the luminescence spectrum, indicating that the conformation of the proteins in the membranes did not change.

Suspensions of all three types of membranes used in the experiment (mitochondria and stroma of erythrocytes from rats and the membranes from the fat globules found in milk) were heated from  $10^{\circ}$  to  $95^{\circ}$ . In all cases there was a gradual long-wave shift in the maximum of luminescence, which was most pronounced in the  $50^{\circ}$ - $80^{\circ}$  interval.

"Processing of Titanium Tetrachloride Pulp in Thin Film Evaporation Apparatus"

Tr. Vses. N-i. i Proyektn. In-ta. Alyumin., Magn. i Elektrodn. Prom-sti [Works of All-Union Scientific Research and Planning Institute of the Aluminum, Magnesium and Electrode Industry], 1970, No. 72, pp. 201-208. (Translated from Referativnyy Zhurnal Metallurgiya, No. 5, 1971, Abstract No. 5 G220 by the authors).

Translation: Laboratory studies of the separation of a solid suspension from  $TiCl_4$  pulp by the evaporation method are performed. The technical product has a lower impurity content than following settling, and does not require additional purification to remove Al and Fe. A large laboratory film type evaporation apparatus is designed and manufactured. It is tested under laboratory conditions using artificial pulp and in the experimental shop of one of the plants using commercial pulp. The tests show that an apparatus of this design can be successfully used for processing of various types of  $TiCl_4$  for pulp, producing high quality technical product and a solid residue consisting of a dry powder. Necessary data are presented for planning of a pilot-scale apparatus. 2 figs; 5 tables.

"A Device for Checking the Formation of a Fused Core in Resistance Welding"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tsvarnyye Znaki,  
No 10, Apr 73, Author's Certificate No 369483, Division G, filed 24 Dec 69,  
published 8 Feb 73, p 127

Translation: This Author's Certificate introduces: 1. A device for checking the formation of a fused core in resistance welding. The device contains an electrode holder with ultrasonic heads located in water-filled cavities of the welding electrodes and connected to a flaw detector, which is connected in turn to control, signalling and registration units. As a distinguishing feature of the patent, inspection effectiveness is improved by making the bottom of the electrode cavity in the form of a cone with a vertex angle which provides effective transformation of the ultrasonic wave on the conical surface from longitudinal to transverse during emission and the reverse during reception. The distance between the bottom and the working surface of the electrode is chosen to depend on the angle  $\psi$ , equal to the difference between the angles of refraction and incidence of the diam-

"Aluminum Work Hardening at Temperature Discontinuities in the Process of Creep"  
Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 29, No 6, Jun 70, pp 1280-1287

**Abstract:** Results are presented of the experimental investigation of increased creep strength of metals resulting from time reduction of temperature in the process of deformation. It is observed that work hardening of metal is clearly manifested only when a considerable density of dislocation loops originates in the boundaries of blocks and near them. It is shown that work hardening involves preliminary deformation of creep, develops in time, and is sensitive to stress and temperature-velocity conditions. The nature of work hardening of metals is discussed. The authors thank V. L. Indenbom, A. N. Orlov, and V. I. Vladimirov for their interest in the work and for discussing the results.

"Reaction of Esters and Esteramides of Thiophosphoric Acid With Substituted  
Benzyl Chlorides"

Leningrad, Zhurnal Obshchey Khimii, Vol 42(104), Vyp 4, 1972, pp 820-825

Abstract: At 150-170°C, O,O'-diethyl N-ethylamidothiophosphate reacts with substituted benzyl chlorides in o-dichlorobenzene yielding the corresponding O-ethyl N-ethylamido S-benzyl thiophosphate. Symmetrical dibenzyl sulfides were also synthesized, probably as a result of the further alkylation of the S-benzyl esters of O-ethyl N-ethylamidothiophosphoric acid. O'-ethyl O-phenyl N-ethylamidothiophosphate reacts with the 4-methoxy- and 4-ethoxybenzylchloride to form the corresponding 4-alkoxybenzyl-N-ethylamine, bis(4-alkoxybenzyl)sulfide, and O-phenyl N-ethylamido S-(4-methoxybenzyl) thiophosphates. This reaction proceeds by the simultaneous attack on two nucleophilic centers. Physical data, formulas and IR and NMR constants are given for the synthesized compounds.

"Synthesis of Mixed Esters of Phosphoric and Phosphonic Acids"

Leningrad, Zhurnal Obshchey Khimii, Vol 42(104), Vyp 4, 1972, pp 816-820

Abstract: The title reaction was carried out by reacting  $\beta$ -halogenated benzoyl-propionic acids with trialkyl phosphites, thereby synthesizing compounds not previously reported in the literature. The reaction can proceed via two pathways: one resulting in the phosphoric acid derivatives; the other in phosphonic acid derivatives. With trimethyl phosphite a mixture of the two types of derivatives result; but with triethyl phosphite, only derivatives of phosphoric acid were detected. Physical properties, elemental composition, and NMR data are given for the studied compounds.

"Organic Insectofungicides. Reaction of Substituted Benzyl Chlorides with  
Dialkyl and Trialkyl Phosphites"

Leningrad, Zhurnal Obshchey Khimii, Vol 41, No 8, Aug 71, pp 1702-1706

**Abstract:** Since there has been insufficient study of the Michaelis-Becker reaction for the synthesis of phosphonates in the case of benzyl halides, the authors undertook to study the reaction of dialkylphosphorous and thiophosphorous acid salts with benzyl chlorides containing various substituents in the benzene ring. Salts of dimethyl-, diethyl-, diisopropylphosphorous acids and diethylthiophosphorous acid were used as the nucleophilic agent. The reaction, conducted in absolute toluene at 70-90° for 3-10 hours, gives 0,0-dialkyl benzylphosphonates. The principal processes occurring in such polar solvents as methanol, methanol-water, methanol-toluene, dioxane-water are methanolysis or hydrolysis of the initial benzyl chlorides. 5-chloro-2-methoxy(2-ethoxy)benzyl chlorides in methanol-water are converted into corresponding benzyl alcohols. The reaction of benzyl chlorides with sodium diethylthiophosphite gives benzylthiophosphonates. Biological studies show that the synthesized 0,0-dialkyl benzylphosphonates possess fungicidal properties.

"Reaction of Aminothiophosphate Esters With Acrylate Esters"

Leningrad, Zhurnal Obshchey Khimii, Sep 71, Vol 41, No 9, pp 1984-1987

**Abstract:** Previous research indicates that aminothiophosphate esters react with acrylonitrile to form addition products at the double bond. The reaction of aminothiophosphates with cinnamate esters yields acylated compounds. This work deals with the reaction of amino thiophosphates with acrylate esters. Monoamino-dithiophosphate esters when treated with methyl acrylate and methyl methacrylate yield addition products at the double bond, contrary to Markovnikov's rule. The course of the above reaction depends on the structure of both the ester and the amine radical.

Translation: The authors synthesized ester-amides of thiophosphoric acid amides and hydrazides of O-alkyl-S-aryldithiophosphoric acid, ester-amides of methyl-, chloromethyl- and trichloromethylphosphonic acids, O-alkyl N, N'- diaryldiamidothiophosphates, O-alkyl N-alkyl-N'-aryldiamidothiophosphates, amides of thiophosphonic acids, dithiocyclodiphosphazanes, and diamides of methylphosphonic acid, in order to study their fungicidal activity. Ester-amides of methylphosphonic acid, although containing groups capable of participating in redox processes, suppress the growth of fungal organisms weakly. Derivatives of thiophosphoric and thiophosphonic acids showed significant fungicidal activity. S-Aryl amidodithiophosphates possess the highest fungicidal activity. The fungicidal activity of the preparations usually rises with an increase of the radical at the nitrogen from C<sub>1</sub> to C<sub>4</sub>.

"Mathematical and Experimental Modeling of the Process of Autoselection  
of Microalgae in Continuous Culture"

Moscow, Fiziologiya Rasteniy, Vol 17, No 6, Nov/Dec 70, pp 1129-1139

**Abstract:** A mathematical analysis was made of the dynamics of growth of a multicomponent population of microalgae. A theoretical basis was developed for automatic competitive selection, and it was demonstrated that productive strains to suit predetermined conditions can be obtained in continuous culture. The theory was tested in a study of the dynamics of growth and change in correlation of forms in a multicomponent population consisting of Chlorella sp. K, Chlorella CO-10, Scenedesmus obliquus 125, and Chlorella vulgaris 7-23-1. Continuous cultivation was carried out at densities corresponding to the different growth stages (exponential and linear) and at various original concentrations of the strains. When the cultures were transferred from less active conditions to a reactor with a high intensity of external parameters, the change in the specific rate of multiplication

pp 1129-1139

was found to lag behind the change in photosynthetic activity by a time interval equal to the period of generation of a given strain. Differences in the average size of cells of strains forming part of the population had no effect on the kinetics of selection. Study of CO<sub>2</sub> exchange in the process of autoselection revealed increased photosynthesis by the multicomponent population due to a change in its qualitative composition. The experimental findings were consistent with the theoretical calculations in both the exponential and linear stages of growth.

"Radiation Induced Oxidation of Fe<sup>++</sup> Ions in Nitrate Solutions"

Moscow, Khimiya Vysokikh Energii, Vol 7, No 4, Jul-Aug '73, pp 348-353

Abstract: Radiation induced oxidation of Fe<sup>++</sup> has been investigated in sulfuric acid solution containing NO<sub>3</sub><sup>-</sup> ions and in nitric acid solution

([NO<sub>3</sub><sup>-</sup>] = 10<sup>-3</sup> -- 0.5 N), with a Co<sup>60</sup>  $\gamma$ -irradiation. The yields of Fe<sup>3+</sup>

ions and HNO<sub>2</sub> molecules formed in aerated and non-aerated solutions have been determined. It was established that the oxidation of Fe<sup>2+</sup> occurs in reactions with OH, HO<sub>2</sub> and NO<sub>2</sub> radicals as well as H<sub>2</sub><sup>+</sup> ions and H<sub>2</sub>O<sub>2</sub>. An increase in the concentration of NO<sub>3</sub><sup>-</sup> ions in the solutions from 10<sup>-3</sup> to 0.1 N leads to an increased yield in the oxidation of Fe<sup>2+</sup>. A mechanism has been proposed for the radiolysis of nitrate solutions containing Fe<sup>++</sup>.

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE PROPOSED USE OF 4.0M HNO SUB3 SOLN. FOR DETG. THE DOSE RATE OF VARIOUS TYPES OF RADIATION IS BASED ON THE EARLIER REPORTED RADIATION DOSE DEPENDENCE OF THE YIELD OF HNO SUB2 IN THE GAMMA RADIOLYSIS OF HNO SUB3 (N. V. VLADIMIROVA, I. A. KULIKOV, YU. I. SAVEL'EV, 1969). A PROLONGED GAMMA IRRADN. OF 2-8M HNO SUB3 SOLNS. LEADS TO THE ESTABLISHMENT OF A CONST. CONCN. OF HNO SUB2, WHICH DEPENDS ON THE CONCN. OF HNO SUB3 AND THE TEMP. THUS, THE ACCURACY OF THIS METHOD DEPENDS OF THE ACCURACY OF THE MEASUREMENTS OF HNO SUB3 CONCN. AND TEMP. THE METHOD HAS VERIFIED BY STUDYING THE DOSE DEPENDENCE OF HNO SUB2 CONCN. USING AN ELECTRON ACCELERATOR AND THE WWR REACTOR. THE USE OF THE PROPOSED HNO SUB3 DOSIMETER IS NOT RECOMMENDED FOR DOSE RATES SMALLER THAN 10 PRIME3 RAD(S)-SEC, BECAUSE IT REQUIRES A LONG IRRADN. PERIOD. THIS DISADVANTAGE MAY BE BENEFICIAL IN THE CASE OF A PROLONGED REACTOR CYCLE. THE PROPOSED METHOD IS INDEPENDENT OF THE KIND OF RADIATION. IT IS RECOMMENDED FOR MEASURING DOSE RATES GREATER THAN 5 TIMES 10 PRIME3 RAD(S)-SEC WITH MIN. IRRADN. TIME OF 3 HR; FOR DOSES 10 PRIME4-10 PRIME6 RAD(S)-SEC THE IRRADN. TIME IS 2-0.5 HR. THE ACCURACY OF THE DOSIMETRY VALUES VARIES BETWEEN 10 AND 15PERCENT.

STUDY OF THE BUILDUP OF PLUTONIUM ISOTOPES IN THE FUEL OF THE

VVER-1 REACTOR OF THE NOVO-VORONEZHSKY ATOMIC POWER STATION

[Article by V. Ya. Gabessiys, V. S. Belopopov, O. A. Miller, G. A. Matvushchik, Scientific Research Institute of Kurchatov Institute; V. V. Smirnov, I. I. Butenkov, Yu. A. Vladimirova, and I. V. Novo-Voronezhskiy Naukno-Prakticheskoye Reaktornoye Nauchnoe Obshchestvo; Vsesoyuzny Plutonivnye i Toplivnye Reaktoros VVER-1, signed to Prosvet, January 1970, 15 pp.]

Introduction

The isotopic composition of irradiated fuel in samples cut from fuel elements of the VVER-1 reactor of the Novo-Voronezhskiy Atomic Power Station was investigated in order to determine experimentally the isotopic composition of irradiated fuel in a reactor of the VVER type within the framework of contract no. 577/PR with the International Atomic Energy Agency. The tasks of this study were:

- (a) determining the uranium and plutonium isotopic composition after irradiation of the fuel;
- (b) determining the number of plutonium isotopes formed as a result of irradiation;
- (c) determining the isotopic composition of the fuel as a function of the degree of burn-up.

1. Preparation of Sample

The assembly from which the fuel element was taken was irradiated for 2.75 years and held for 1.5 years before the investigation.

"Effect of Magnetic Structure on Internal Friction of Nickel and Ferronickel Alloys"

Sb. "Vnutrenneye treniye v metallicheskikh materialakh" (Internal Friction in Metallic Materials), Moscow, Izd-vo "Nauka," 1970, pp 187-191

Abstract: The effect of tensile stresses and heat treatment on the ferromagnetic internal friction of nickel, permalloy-66, and permalloy-50 is studied.

It is shown that the effect of external static tensile stresses on internal friction and vibration period depends on both the magnitude and sign of saturation magnetostriction of a given material. Hysteresis of the logarithmic decrement  $\delta$  and of vibration period  $T$  was experimentally revealed from the magnitude of tensile stresses.

The effect of heat treatment for 66%Fe, 80%Ni alloys was determined. The magnetic structure obtained as a result of heat treatment affects the internal friction. 4 figures, 3 references.

VLADIMIROVA, V. L., and LAVRENT'YEV, F. F."The Temperature Dependence of the Yield Point of Hexagonal Metals at Low Temperatures"

Khar'kov, Fiz. Mekhanizmy Plastich. Deform. pri Nisk. Temperaturakh -- Sbornik (The Physical Mechanisms of Plastic Deformation at Low Temperatures -- Collection of Works), 1971, pp 7-10 (from Referativnyy Zhurnal, Mekhanika, No 2, Feb 72, Abstract No 2V472 by L. I. Mirkin)

Translation: An investigation is made of the influence of the temperature, purity, and deformation rate upon the critical shear stress in monocrystals of zinc (99.999 and 99.9%), cadmium (99.98%), and magnesium (99.99%). The initial density of the dislocations is determined; depending upon the crystal purity, this comprises from  $10^4$  to  $10^7$  cm $^{-2}$ . Deformation was carried out by simple shear and by compression in planes 0001 and directions 1120 at rates from  $8 \times 10^{-4}$  to  $2 \times 10^{-2}$  and at temperatures from 1.4 to 3000°K. The result was obtained, that in crystals of high purity virtually no relationship exists between the critical shear stress and the temperature. In crystals of lesser purity, an anomalous relationship appears between the critical shear stress and the temperature (increase of the critical shear stress with a temperature

decrease in the interval of 300-40° K, and a decrease of the critical shear stress with a temperature decrease from 40 to 1.4° K). Analysis of data of the change of dislocation mobility in relation to the temperature showed that constancy of the critical shear stress may be linked to simultaneous matching of increase of the rate and decrease of the density of the dislocations. The observed relationship of the critical shear stress to the temperature in crystals of lesser purity is linked to an infraction of this matching, due to the presence of admixtures. Furthermore, the dislocation rate is not a function of purity; the entire change is linked to the decrease of density of the mobile dislocations. For magnesium crystals, the relationship of the critical shear stress to the temperature is considerably affected by the deformation rate. Other conditions being equal, an increase of the deformation rate brings about an increase of the critical shear stress. A linear relationship of the critical shear stress to the logarithm of the deformation rate is observed at all temperatures, and as the temperature decreases, there takes place a parallel shift of the straight line into the region of higher critical shear stresses. At zero stress the activation energy equals  $5 \times 10^{-2}$  ev, at temperatures of 300 and 2/3

"The Role of Forest Dislocation in the Plastic Deformation of Zinc Single Crystals"

Sverdlovsk, Akademiya Nauk SSSR, Fizika Metallov i Metallovedeniye, Vol 29, No 1, Jan 70, pp 150-156

**Abstract:** The role of forest dislocation in the plastic deformation of zinc single crystals was studied. The effect of forest dislocation density  $\rho_f$  in the  $\{112\} <1123>$  system on parameters of the work-hardening curve for displacement in the  $(0001) <1120>$  zinc crystal system (99.99%) at a temperature of  $293^{\circ}\text{K}$  was investigated. The forest dislocation density varied from  $10^3$  to  $10^7 \text{ cm}^{-2}$ . It is shown that the flow stress  $\tau_t$ , the hardening modulus at the A stage  $G_A = d\tau/d\varepsilon$ , and the extent of the A stage  $a_A = \rho_f e/e$  vary substantially with increasing forest dislocation density. The flow stress is described by the relation  $\tau_t = \tau_0 + a G B \rho_f^{1/2}$ , where  $\tau_0$  is the stress at  $\rho_f = 0$  for  $\varepsilon$  deformation;  $G$  is the displacement modulus;  $b$  is the Burgers vector; and  $a = 1.9$  is the slope coefficient.

USSR

LAVRENT'EV, F. F. et al., Akademiya Nauk SSSR, Fizika Metallov i Metallovedeniye,  
Vol. 29, No 1, Jan 70, pp 150-156

The  $\sigma$  ( $\rho_c$ ) dependence is described by the deformation curve with a maximum, while  $a_A(\rho_c)$  decreases monotonically down to zero at  $\rho_c = 10^7 \text{ cm}^{-2}$ . The variation of the above-mentioned parameters is tentatively explained by the change of controlling mechanisms hindering the dislocation multiplication. In the range of  $\rho_c$  from  $1 \times 10^3$  to  $3 \times 10^6 \text{ cm}^{-2}$ , the dislocation movement is hindered by the controlling mechanism determining the work-hardening, while from  $3 \times 10^6 \text{ cm}^{-2}$  and up the work-hardening is controlled by the dislocation multiplication. The microstructures of zinc crystals with consecutively increasing dislocation density in the  $\{1122\} <1123>$  system from  $8 \times 10^3$  to  $\sim 10^7 \text{ cm}^{-2}$  are presented. Moscow, Meditsinskaya Parazitologiya i Parazitarnyy Bolezni, Vol. 39, No 6, 1970, pp. 718-722

**Abstract:** The sensitivity of mosquitoes and horseflies to the fumes of such repellents as furan-2-carboxylic acid diethylamide (P-320), benzoic acid diethylamide (P-2), etc. is closely related to the insects' vital processes, particularly to the intensity of respiration and gas exchange. They are most active when the temperature and relative humidity are optimum and therefore react most sharply to repellents. The repellent effect is possible only in close propinquity to the surface treated with the substance, i.e., at fairly high concentrations of fumes in the air. This determines the amount of fumes that may penetrate into the trachea and the degree of irritation of the insects' olfactory receptors. The meteorological and other conditions intensifying physiological functions (respiration 1/2

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. IN ORDER TO PREPARE EFFECTIVE REPELLENT DRUGS AGAINST BLOOD SUCKING INSECTS IT IS NECESSARY TO KNOW HOW GREATLY THEIR REACTION TO THE DRUGS CHANGES DEPENDING UPON PHYSIOLOGICAL CONDITION. THIS PROBLEM AT PRESENT HAS BEEN LITTLE STUDIED. THE PAPER PRESENTS THE RESULTS OF EXPERIMENTS DETERMINING THE SENSITIVITY OF MOSQUITO POPULATIONS TO VAPOURS OF REPELLENTS IN RELATION TO THE SEXUAL STATE, AGE, STATE OF FEEDING AND WATER BALANCE. THE TESTS WERE CARRIED OUT BY MEANS OF OLFACTOMETER IN AEDES AEGYPTI L., AEDES VEXANS MEIG., ANOPHELES MACULIPENNIS MEIG. MOSQUITOES. FEMALE MOSQUITOES REACTED TO REPELLENTS MORE ACUTELY THAN MALES. FOR FEMALE AE. AEGYPTI THE HIGHEST SENSITIVITY WAS OBSERVED AT THE AGE OF ABOUT 3 WEEKS. REPELLENTS AFFECTED ENGORGED FEMALES GREATER THAN EMPTY FEMALES. SENSITIVITY OF MOSQUITOES TO REPELLENT VAPOURS REDUCED WITH A DECREASE IN THE CONTENT OF WATER IN THEIR BODIES. ACCORDINGLY, RESPONSE OF MOSQUITOES TO REPELLENTS IS CLOSELY RELATED WITH THEIR ACTIVITY AND DEPENDS UPON THE CHARACTER OF FEEDING, WATER BALANCE AND AGE.

"Polyester Hermetic-Sealing Compounds"

Moscow, Plastichekiye Massy, No 6, 1970, pp 61-62

Abstract: The authors studied compounds for the hermetic sealing of horizontal output transformer coils for television receivers. These compounds should have low viscosity in the initial state and a high hardening rate up to 100°C. In the hardened state they should possess self-extinguishability, water resistance, good mechanical and electric insulation properties, and stability of properties up to 120°C. The principal components chosen were polyester resins PN-1 and PN-69. Because of the requirement of self-extinguishability, special additives (antimony trioxide and chlorine- or fluorine-containing polymers) were introduced into the resins. In addition, mineral fillers (talc, mica, powdered quartz, titanium dioxide, powdered silica gel, etc.) were added to give the sealing compounds

"Stability of the Thermomechanical Strengthening Effect in Gonzo Nickel Steel"

Sverdlovsk, Fizika Metallov i Metallovedeniye, Vol 35, No 2, Feb 73, pp 403-  
408

Abstract: The effect of repeated heating after prior thermomechanical treatment on the properties and structure of austenite and martensite was studied for 60N20 steel which had the following chemical composition (in %): 0.61 C, 20.44 Ni, 0.11 Mn, 0.18 Si, 0.010 S, and 0.001 P. Temperatures of the direct  $M_s$  and inverse  $A_s$  martensite transformation were -35 and +420°C, respectively. Results of mechanical tests and electron microscopy examinations showed that the effect of thermomechanical strengthening is preserved during the repeated heatings to 650 and 950°C, followed by quenching, because the accelerated heating promotes growth in the strength properties of the austenite and martensite as a result of phase cold hardening. The morphological features, forming in the austenite during repeated quenching, are the result of the reverse alpha-gamma transformation. In austenitic samples, subjected to high-temperature thermomechanical treatment with repeated quenching, preservation of the developed polygonal

ABSTRACT/EXTRACT--(U) GP-0- ABSTRACT. THE DATA WERE ANALYZED CONCERNING THE LEADING CAUSE OF HYPERPLASIA IN ACUTE LEUKOSIS. NUMBER OF MITOTIC CYCLES PASSED BY LEUKEMIC CELLS CAPABLE OF DIVISION, WITH RETENTION OF NORMAL RATE OF REPRODUCTION. THE PRINCIPAL PECULIARITY OF LEUKEMIC POPULATION IN ACUTE LEUKOSIS IS ITS UNHOMOGENEITY; I.E. DIVISION INTO DIVIDING AND NONDIVIDING SUBPOPULATION. THE FORM AND THE COURSE OF ACUTE LEUKOSIS LARGELY DEPENDS ON INTERRELATIONS BETWEEN THESE 2 LEUKEMIC SUBPOPULATIONS.

"A Device for Checking Variation in the Standard Deviation of a Random Variable"

Moscow, Otkrytiya, Izobreteniya, Promyshlennyye Obraztsy, Tovarnyye Znaki, No 4, 1970, p 99, patent No 260970, filed 12 May 68

Abstract: This Author's Certificate introduces a device for checking variation in the standard deviation of a random variable. The device contains two flip-flops, an electronic switch, two AND circuits, and a reversible binary counter. As a distinguishing feature of the patent, the device is simplified by connecting the reset terminal of the first flip-flop and the set terminal of the second flip-flop to the first input terminal, connecting the set terminal of the first flip-flop through the electronic switch to the second input terminal, connecting the counter input of the second flip-flop to the third input terminal, and connecting the first inputs of the AND circuits to the fourth input terminal. The second input of the first AND circuit is connected to the zero-output terminal of the first flip-flop,

the second input of the second AND circuit is connected to the set terminal of the first flip-flop, the inhibit inputs of the AND circuits are connected to the electronic switch input and the zero-output terminal of the second flip-flop, and the outputs of the first and second AND circuits are connected to the adding and subtracting inputs respectively of the reversible counter.

"A Method of Filmless Information Recording From Wire Spark Chambers in a Strong Magnetic Field"

Moscow, Fribory i Tekhnika Eksperimenta, No 5, 1973, pp 55-56

**Abstract:** The basic idea of this method is the recording of ultrasonic oscillations arising from the interaction of a current induced in a sonic conductor with an external magnetic field. The present article explores the use of the electrodynamic method, with an intense magnetic field, in the filmless information recording system, based on this idea, involving wire spark chambers with ferrite and magnetostriiction information recording. The exploration was first conducted with models and then on a mock-up of the wire spark chamber measuring 1200X650 mm<sup>2</sup>, filled with a Ne+He mixture, in a magnetic field with an induction of 18 kilogauss. This method was found to have a high sensitivity and is capable of use with magnetic fields stronger than 1 kilo- oersted, a field intensity at which other methods are ineffective.

"The  $K^- p \rightarrow K^0 n$  Charge Exchange Reaction at a Pulse of 39 Gev/sec"

Moscow, Yadernaya Fizika, Vol 18, No 3, Sep 73, pp 542-544

**Abstract:** The authors present the measurement results from studying the charge exchange reaction of  $K^-$ -mesons on protons ( $K^- p \rightarrow K^0 n$ ) at a pulse of 39 Gev/sec. The study was carried out using the ITF-6-m magnetic track spectrometer. The working volume of the magnetic field of the spectrometer was  $1.0 \times 1.5 \times 6$  m. Twelve optical spark chambers were located inside the magnet, with each chamber having eight spark gaps (10 mm each). The chamber electrodes consisted of two layers of aluminum foil 14 microns thick. The photographs were taken through a special slit in the magnet yoke. A mirror system made it possible to obtain three stereoprojections of all of the chambers

BALOSHIN, O. N., et al., *Yadernaya Fizika*, Vol 18, No 3, Sep 73, pp 542-544  
with one camera. The reaction was studied on the negative particle beam of  
the IFVE accelerator. The K<sup>-</sup>mesons were distinguished by a differential  
Cerenkov counter. The beam was focused on a liquid hydrogen target 40 cm long  
which was set approximately three meters from the first chamber of the spectrome-  
ter. Approximately 5·10<sup>7</sup>K<sup>-</sup>mesons were passed through the equipment and 1020  
photographs taken. Pairs of uniformly charged tracks were measured on the  
photographs. The measurement results were then processed on the Razdan-3 com-  
puter. Only 270 intersecting tracks were found. A graph is given for the  
differential cross section of the reaction. The results show that the cross  
section value of  $7.4 \pm 1.2$  microbarns obtained by the authors in comparison  
to data obtained for lower energies elsewhere shows the logarithmic  
dependence of the charge exchange cross section on the pulse, equal to  $-1.58 \pm 0.05$ .  
The authors thank K. G. Boreskov, A. M. Lapidus, S. T. Sukhorukov, and K. A.  
Ter-Martirosyan for their presentation of the computational results as the  
dependence of the differential cross section on pulse transfer ( $d\sigma/dt$ ). This  
dependence is compared with predictions of the Regge pole model.

"Study of the Reaction  $\pi^- p \rightarrow p\chi^-$  at a Momentum of 3.25 GeV/c With a High Momentum Transfer"

Moscow, Yadernaya Fizika, Vol 14, No 1, Jul 71, pp 131-133

**Abstract:** The authors investigate the spectrum of missing masses of a proton in the reaction  $\pi^- p \rightarrow p\chi^-$  for high transfer momentums using a track spectrometer with optical spark chambers in a magnetic field. They found the momentum of the primary  $\pi^-$  mesons to be 3.25 GeV/c, and they measured the differential cross section of the formation of the  $\rho^-$  meson in the range of angles  $-1 \leq \cos \theta^* \leq -0.0005$ , which was found to be equal to  $28.2 \pm 9.8 \text{ nbarn/sterad}$ . Figure 1 shows the spectrum of the missing masses in this reaction for a momentum of the  $\pi^-$  meson of 3.25 GeV/c. Figure 2 shows the cross section of the creation of the  $\rho^-$  meson backwards in the reaction  $\pi^- p \rightarrow p\chi^-$  as a function of the momentum of the  $\pi^-$  mesons. The article contains 2 figures and 5 bibliographic entries. 1/1

112479f Effect of x-ray radiation on the rate of polyisoprene diffusion into rubber. Vladimirov, Yu. B.; Zakhurov, G. M.; Rylov, S. A. (Leningrad. Politekh. Inst. im. Kalinina, Leningrad, USSR). Vysokomol. Soedin., Ser. B 1970, 12(2), 165-6 (Russ).

The diffusion of tagged polyisoprene (I) (mol. wt.  $2 \times 10^4$ ) into natural rubber (II) irradiated with x-rays at a dose rate of 700 R/sec in Ar, O<sub>2</sub> or air was studied. The diffusion coeff. of I declined from  $1.8 \times 10^{-13}$  to  $0.6 \times 10^{-13} \text{ cm}^2/\text{sec}$  after II had been irradiated in Ar with 0 to  $2.6 \times 10^4$  rads, suggesting that radiative crosslinking had occurred. Irradn. of II with  $7 \times 10^5$  rads in the presence of O<sub>2</sub> was accompanied by increased mol. mobility and lower diffusion coeff. due to competing degradation and crosslinking.

"Remarks on Nonlinear Mappings of Locally Convex Spaces"  
Kishinev, Izvestiya Akademii Nauk Moldavskoy SSR: Ser. Fiz.-tekhn. i mat.  
nauk, No 2, 1973, pp 3-9

**Abstract:** Let  $X$  and  $Y$  be Banach spaces, the morphism  $f:X \rightarrow Y$  being defined and differentiable in the vicinity of the point  $x_0 \in X$ , and  $f'$  being continuous at  $x_0$ . It is known that if  $f'(x_0)$  is an isomorphic imbedding under these assumptions, then  $f$  makes a homeomorphism of some neighborhood  $U$  of the point  $x_0$  with  $f(U)$ ; on the other hand if  $f'(x_0)$  is surjective, then  $f$  maps some neighborhood  $U$  of the point  $x_0$  into the neighborhood  $f(x_0)$  in  $Y$ . In this paper these facts are extended to locally convex spaces. As a corollary, the author notes one variant of a theorem on the inverse function for locally convex spaces.

ANTICANDIDIAL PROPERTIES OF CERTAIN DERIVATIVES OF  $\beta$ -NITROSTYROLB. Ye. Bilich, V. M. Cherkasov, I. F. Vladimirov

## Summary

The author studied anticandidial activity of 20  $\beta$ -nitrostyrols, of which 4-bromo- $\beta$ , $\beta$ -methylnitrostyrol was found to be the most active and the least toxic. It produced a strong anticandidial effect inhibiting the growth of different species of *Candida* fungi in concentrations of 1—5.1 ug/ml. This property of the drug is combined with a marked capacity to inhibit the growth of staphylococci and streptococci. 4-Bromo- $\beta$ , $\beta$ -methylnitrostyrol is moderately toxic for white mice ( $LD_{50}$  by the subcutaneous route is  $421 \pm 1.3$  mg per kg by the intraperitoneal route  $75.2 \pm 1.1$  mg per kg).

In treatment of visceral candidiasis of mice 4-bromo- $\beta$ , $\beta$ -methylnitrostyrol showed nearly the same chemotherapeutic effectiveness as nystatin, and was also effective in treatment of candidial lesions of the rabbit skin.

"Biological Activity of Substituted  $\alpha'$ -nitrostilbenes"

Fiziol. aktivn. veshchestva. Resp. mezhved. sb. (Physiologically Active Substances. Republic Interdepartmental Collection), 1972, No 4, pp 139-142  
(from RZH-Khimiya, No 2 (II), Feb 73, Abstract No 2N507)

Translation: In order to obtain plant growth regulators and fungicides, a number of derivatives of styrene and stilbene were synthesized;  $\text{PhCH}=\text{CH}_2$  suppresses the growth of oat roots in a concentration of 0.01% by 56%, and in a concentration of 0.001%, by 60%, and it suppresses the leaf growth by 45 and 21% respectively. The  $\text{PhCH}=\text{C}(\text{NO}_2)\text{Ph}$  (I) has a significant inhibiting effect. In a 0.01% concentration it suppresses the growth of oats and lettuce by 79%. The  $\text{PhCH}=\text{CHNO}_2$  not only suppresses growth but causes the plants to die. The fungicidal activity of I approaches that of figon;  $\pi\text{-Br-}$  and  $\pi\text{-Cl-I}$  are of practical interest as root and stalk growth stimulators.
